

Have horses? Worried about Strangles and Ringworm? You need DIS-IN-FECT!!

Defra-approved DIS-IN-FECT is already perfect for use when there is an outbreak of a notifiable disease and **any** statutory or General Orders disinfectant is required. The **DIS-IN-FECT General Orders dose is 3 Tablets in 5L.**

Now, DIS-IN-FECT has been **scientifically proven** to kill *Strep. equi* which causes the rampantly contagious and horrible disease **Strangles**, AND *Trichophyton equinum* and *Microsporum equinum* which are the two primary fungi responsible for the highly contagious skin infection, **Ringworm**. For **Strangles** the required dose is **6 tablets in 5L** of water and for **Ringworm** **12 tablets in 5L** of water.

This makes DIS-IN-FECT your perfect partner for biosecurity

Here's the science bit...

Streptococcus equi subsp. equi NCTC 9682 (strangles), tested against BS EN 1656:2009 quantitative suspension test, and BS EN 14349:2012, quantitative surface test: Tested at a standard 5-minute contact time met the requirements of the standards giving 'PASS' results.

Trichophyton equinum NCPF 0673 and *Microsporum equinum* NCPF 0281 (ringworm), each tested against BS EN 1657:2016 quantitative suspension test. Tested at a standard 30-minute contact time, both met the requirements of the standard giving 'PASS' results.

Don't neglect, intercept with DIS-IN-FECT

AGMA is an international company providing decontamination and environmental protection solutions. Visit our dedicated website <https://stablemateagma.com> for all your equine needs or give us a call - we would love to help!
